

## FF3us Ending Names Mapping 1.0

After being undocumented for a long time, the secret of the characters names in the ending scene of FF3us has been discovered, from the data point of view. Here's the complete mapping of the data, as well as letter values, charts, and the general structure of the data is detailed.

This document is finalized for now. The routines involved are in bank C3, and cover a wide sector in the ROM. There are still many unknown routines, hence the reason why those are not included in this document.

## 0B. Common format explanation

C2/XXXX:NN (At the beginning of each name)

**NN** = Word length. The game considers capital letters to be three (3) parts (three small pieces making a large letter). A normal letter has two (2) parts in it, and smaller letters are considered as one (1) part.

As an example, consider the name of the main character, "Terra". The letter "T" is capitalized, hence it's equivalent to 3 part. The letters "e", "r", "r" and "a" are worth two parts each, and if we add them all together we get: "Terra" = 0B (3+2+2+2+2). Likewise, the word HELLO is 14 parts long ("HELLO" = 0E (3+3+3+3+3)).

### Format 31 letter (normal letter):

C2/AAAA:X1 Y1 L1 F1 (top half of the letter)

C2/BBBB:X2 Y2 L2 F2 (bottom half of the letter)

Where

**X1** = Position on the X axis for the top part of the letter.

**Y1** = Position on the Y axis for the top part of the letter. In general,  $Y1 = Y2 - 0x08$ .

**L1** = Number of the top part of the letter. In general,  $L1 = L2 - 0x10$ .

**F1** = Format\* of top part of the letter. In general, it has the same value as F2.

**X2** = Position on the X axis for the bottom part of the letter. In general, it has the same value as X1.

**Y2** = Position on the Y axis for the bottom part of the letter. In general,  $Y2 = Y1 + 0x08$ .

**L2** = Number of the bottom part of the letter. In general,  $L2 = L1 + 0x10$ .

**F2** = Format\* of bottom part of the letter. In general, it has the same value as F1.

\* Known formats to date:

29 - Red letter

31 - Normal format

32 - Letter fades away faster

33 - Small letter (doesn't work with every value)

*Note: Other formats produce glitches but this parameter hasn't been extensively tested.*

### Format 33 letter (small letter):

A Small letter is made of a single part (4 bytes). Not every letter may be using this format but some letters other than "a" and "s" ("as") can be written that way. Not all possibilities have been tested yet.

### Capital Letter

A Capital letter is made of 3 parts (12 bytes). The first part is usually the top half of the letter and the other two other parts together make the bottom half.

## 0C. Pointer Tables

### Pointers to names pointers with starting X coordinate

C2/XXXX: **P1 P1 X1 P2 P2 X2**

P1: Pointer to 1st part of the name.

P2: Pointer to 2nd part of the name.

X1: Starting X position of first name.

X2: Starting X position of second name(00 = none).

C2/8E32	89 8E 64 8C 8E 00	<i>Umaro</i>	(68, 00)

\*Locke is the only character that has a second starting position and no second name length.

His name is counted as one string. This might suggest that those position bytes have an extra role.

Please let me know if you find any mistake in this document.

### Credits:

- **Angelo** for initial data location and good first theory.
- **GiNattak** for locating the area where the names are written in the ending. He provided Angelo with this data in the first place.
- **NPCnextdoor** for pointing out a few mistakes in the document and finding “and you”.

Version: 1.4
